Using Automotive Touch-Up Paint

(NAPSA)—Here's news you may want to brush up on: Using touch-up paint on your car can be an inexpensive way to protect its value. Some scratches can remove all the paint down to the metal and the area can begin to rust, causing permanent damage.

There are several choices for applying touch-up paint. Spray cans can be used for large areas and with patience and practice you can achieve excellent results. For smaller chips and scratches, you can brush the paint or use a paint pen. Often, a paint pen will be easier to apply to very small chips, as you can apply the paint more precisely.

With the right paint and good instructions, applying touch-up paint to your car can be as easy as coloring your nails.

Women find using touch-up paint is easy because they have had so much practice applying nail polish. In fact, according to paintscratch.com, some women have even painted their nails with automotive touch-up paint to match their vehicles.

The easiest place to find touch-up paint is on the Web. First you have to know your color code. There are sites where the paint colors are broken down by year, make and model, so finding your color code is easy. With the correct paint and good instructions, applying touch-up paint should be no more difficult than coloring your nails.
