

Software Protects Kids On Internet

(NAPSA)—Many parents may become better informed thanks to new technology.

Consider the case of Bob Watkins. He knew something was bothering his 13-year-old step-daughter. She had been a straight A student, but her grades were falling and she was spending more and more time on the Internet.

An effective solution to inappropriate use of the Internet may be software that discretely records every Web site visited and every keystroke typed.

Through an innovative software program, Watkins was able to record everything his daughter was doing on the Internet. He discovered she was being molested by her teacher.

The software, called Spector, discretely records every e-mail, every chat conversation, every instant message, every Web site and every keystroke typed.

It recorded the e-mails and chat conversations between the girl and her teacher who was arrested and convicted.

More information on Spector is available at www.spectorpro.com or 1-888-621-1143.
