Fungus Infects Up To 70 Million Feet!

(NAPSA)—Warm weather means fun in the sun and showing off your feet. However, many Americans are embarrassed by their toes because they suffer from toenail fungus, or onychomycosis. Although it is one of the most common podiatric conditions, onychomycosis can become a serious infection when it goes untreated.

Toenail fungus isn't just embarrassing; it can lead to a potentially fatal infection.

It has been estimated that 60 percent of Americans 55 or older have toenail fungus and 20 percent of those between the ages 30 and 45 have at least one infected nail. The risk of an untreated local infection becoming a systemic problem can be life threatening. People with diabetes and smokers are most vulnerable to fungal nail infections. Other risk factors for onychomycosis include nail trauma, poor hygiene and aging.

Fortunately, there's a podiatrist-recommended treatment that kills the germs that cause fungal infections that can lead to onychomycosis. With nonprescription Mycocide NS, you can treat fungus infections without removing nail polish or acrylic nails. You can find the product in the foot care section at any drugstore or major retailer.

More information about Mycocide NS is available at www.woodwardlabs.com.
