## An Alternative View On Curing Blindness

(NAPSA)—A new book offers an alternative approach to treating a condition that threatens the vision of an increasing number of Baby Boomers.

This condition, known as age related macular degeneration (ARMD), will affect up to 30 million Americans by the year 2010. Most people affected by ARMD are over 65, but certain hereditary conditions may cause it to develop in younger individuals.

Until recently, people with ARMD had no alternative but to get used to living without their sight.

In *Miracle Eye Cure* (North Atlantic Books, \$24.95) author Edward C. Kondrot, MD offers new hope for reversing eye disease with a procedure known as microcurrent stimulation.

“Microcurrent stimulation is a relatively new treatment for the treatment of the eye. Currently, only five medical doctors, including myself, have been involved with a preliminary study using MCS in the treatment of macular degeneration,” said Kondrot. “Where patients have been treated with microcurrent stimulation, all the testing centers have reported positive results, such as 60 to 80 percent of the patients reporting improved vision.”

Microcurrent stimulation is a weak electrical current applied with a device known as a Micro Stim, which was originally created to treat pain.

Treatment usually involves six to eight treatments during a period

**Getting old and going blind is not your only recourse, says a new book.**

of four days, then patients may proceed with home treatments twice a day for three months.

In his book, Kondrot also recommends other vision therapies, such as improving your diet and adding nutritional supplements.

“Dr. Kondrot has done an amazing job at outlining a program of vision care and treatment that can benefit those with macular degeneration and other retinal diseases,” said Damon P. Miller II, M.D.

Kondrot is an ophthalmologist with a degree in homeopathy. He is also the author of *Healing the Eye the Natural Way*.
