

Decked Out With Style

A New Deck May Mean More Fun, More Value And More Storage

(NAPSA)—A great deck can increase the value of your home. In addition, whether it's a first or second floor addition, that void left below your new deck can be transformed into a space that is dry, attractive and useable. With easy, economical installation of a deck drainage system your family can gain dry storage space for lawn care items, sports gear and more or, depending on ceiling height, create a living area that can be enjoyed even in inclement weather.

The components for this DrySpace Deck Drainage System are extruded, in off-white, weatherable PVC that creates a clean, bright, finished look to your under-deck ceiling. Installation is easy for 16- or 24-in. on-center joist decks. An innovative F-bracket fastening clip (size appropriate for joist space) attaches to the joist sides by nailing firmly, but not tightly, in place through an initially installed "U" joist cover, where waterproofing has been enhanced with a bead of adhesive caulk applied to the top of both sides. To complete installation just snap or slide the rigid 14¼-in. wide concave V-panel into the F-brackets with the panel pointing down to channel water away from the house.

When you get down to it, you can create great storage space under your deck as well as a place to play above.
