

INTS FOR OMEOWNERS

New Technology Offers Security On The Go

(NAPSA)—A new approach to home security is designed to offer homeowners convenience, confidence and peace of mind while away from home. Communication is the key.

One company has introduced a security system that communicates with emergency centers through three ways: cell phone networks, text messaging and the Internet.

The system, from Honeywell, is said to provide communication to emergency personnel while also giving home and business owners remote access to their security systems through cell phones and laptops.

New technology controls the security system and informs homeowners from Internet-enabled devices such as PCs, laptops and cell phones.

For example, if you forgot to arm your system before leaving for work, simply send a text command through your cell phone or go online to arm the system. Parents can keep track of their children returning home from school from the convenience of their office computers.
