

The Fight Against Rising Heating Costs

(NAPSA)—The comfortable feeling of being in control of the little things in life has quickly given way to a storm of feeling out of control that has stemmed from one very critical paradigm shift—fuel costs rising as much as 70 percent.

“A zone space heater is the answer to so many concerns and needs,” says Ken Maitland, Director of Engineering for Desa Heating. “We are able to provide economical heating that is both comfortable and smart.”

Consumers can reclaim control of their home, save money and be comfortable using technology available in new products like Desa’s Solar Fusion, a vent-free space heater. As suggested by the Department of Energy, dialing down the home thermostat can save you 10 percent on your heating bill and employing zone heating makes economic and comfort sense.

Using a gas, vent-free space heater keeps all the heat you pay for in the areas you use most. Unlike traditional space heaters, Solar Fusion combines both radiant (warms like the sun) and convection (moving air) heat for a comfortable and 99.9 percent efficient option. All the heat you pay for stays in the room. And Solar Fusion doesn’t depend on electricity; it keeps working even during power outages.
