

# SAFETY SENSE

## Don't Feel The Burn

(NAPSA)—Health and safety is a hot topic now, especially for children, senior citizens and the disabled. According to the National Safe Kids campaign, scald burns injure over 35,000 people a year. Tap water scald injuries have been cited as the second most common cause of serious burn injuries.

**Young children may have trouble avoiding scalding hot water.**

Simply lowering the water temperature is no solution. A water heater set below 145 degrees is a breeding ground for the bacteria that cause legionellosis, or Legionnaire's disease. Water at that temperature can cause third-degree burns in just five seconds.

Now there's a way to keep your family out of hot water—literally. An easily self installed safety device from Antiscald Inc. called ScaldShield™ can help. It stops the flow of water on any shower, sink or bath when the temperature goes above 120 degrees—the maximum temperature permitted by many institutional and building codes.

For more information on hot water safety or to order ScaldShield™, go to [www.antiscald.com](http://www.antiscald.com) or call 1-718-268-7126.
